## Question 2

## Sound Propagation

## Introduction

The speed of propagation of sound in the ocean varies with depth, temperature and salinity. Figure 1(a) below shows the variation of sound speed $c$ with depth $z$ for a case where a minimum speed value $c_{\mathrm{O}}$ occurs midway between the ocean surface and the sea bed. Note that for convenience $z=0$ at the depth of this sound speed minimum, $z=z_{S}$ at the surface and $z=-z_{b}$ at the sea bed. Above $z=$ $0, \mathrm{c}$ is given by;

$$
c=c_{\mathrm{O}}+b z
$$

Below $z=0, c$ is given by;

$$
c=c_{\mathrm{O}}-b z
$$

In each case $b=\left|\frac{d c}{d z}\right|$, that is, $b$ is the magnitude of the sound speed gradient with depth; $b$ is assumed constant.

Figure 1 (a)

Figure 1 (b)

Figure 1(b) shows a section of the $z-x$ plane through the ocean, where $x$ is a horizontal direction. At all points along the $z-x$ section the sound speed profile $c(z)$ is as shown in figure 1(a). At the position $z=0, x=0$, a sound source $S$ is located. Part of the output from this source is described by a sound ray emerging from $S$ with initial angle $\theta_{o}$ as shown. Because of the variation of sound speed with $z$, the ray will be refracted, leading to varying values along the trajectory of the ray.
(a) (6 marks)

Show that the initial trajectory of the ray leaving the source $S$ and constrained to the $z-x$ plane is an arc of a circle with radius $R$ where:

$$
R=\frac{c_{o}}{b \sin \theta_{o}} \text { for } 0 \leq \theta_{0}<\frac{\pi}{2}
$$

(b) (3 marks)

Derive an expression involving $z_{S}, c_{O}$ and $b$ to give the smallest value of the angle $\theta_{o}$ for upwardly directed rays which can be transmitted without the sound wave reflecting from the sea surface.
(c) (4 marks)

Figure 1(b) shows the position of a sound receiver $H$ which is located at the position $z=0, x=$ $X$. Derive an expression involving $b, X$ and $c_{O}$ to give the series of values of angle $\theta_{O}$ required for the sound ray emerging from $S$ to reach the receiver $H$. Assume that $z_{s}$ and $z_{b}$ are sufficiently large to remove the possibility of reflection from sea surface or sea bed.
(d) (2 marks)

Calculate the smallest four values of $\theta_{o}$ for refracted rays from $S$ to reach $H$ when;
$X=10,000 \mathrm{~m}$
$c_{\mathrm{O}}=1,500 \mathrm{~m} / \mathrm{s}$
$b=0.02000 \mathrm{~s}^{-1}$
(e) (5 marks)

Derive an expression to give the time taken for sound to travel from $S$ to $H$ following the ray path associated with the smallest value of angle $\theta_{o}$, as determined in part (c). Calculate the value of this transit time for the conditions given in part (d). The following result may be of assistance:

$$
\int \frac{d x}{\sin x}=\ln \tan \left(\frac{x}{2}\right)
$$

Calculate the time taken for the direct ray to travel from $S$ to $H$ along $z=0$. Which of the two rays will arrive first, the ray for which $\theta_{o}=\frac{\pi}{2}$, or the ray with the smallest value of $\theta_{o}$ as calculated for part (d)?
