

## Parallel Dipole Line Magnetic Trap for Earthquake & Volcanic Sensing (10 points)

### A. BASIC CHARACTERISTICS OF PDL TRAP

#### 1. Determination of the magnet's magnetization ( $M$ ) (2.5 pts)

Question	Answer	Marks																																																												
A.1 0.1 pts	<p>Record zero offset (<math>B_0</math>) of the Teslameter without any magnet nearby. Subtract subsequent field measurement with this value</p> <p>Example from a Teslameter unit: <math>B_0 = 0.86</math> mT</p>	<p>0.08 pts range (-10 mT to 10 mT)</p> <p>Correct unit: 0.02 pts</p>																																																												
A.2 1.15 pts	<p>Measure magnetic field <math>B</math> vs. <math>x</math> in the near field region (<math>7 \leq x \leq 16</math> mm). <u>Where <math>x</math> is the position measured from the center of the magnet.</u> Record and plot your result on the answer sheet.</p> <p><math>x_0 = 4</math> mm, <math>B_0 = 0.86</math> mT. <math>\Delta x</math> is measured from surface. <math>B = B_{raw} - B_0</math></p> <table border="1" style="width: 100%; border-collapse: collapse; margin-top: 10px;"> <thead> <tr> <th><math>\Delta x</math> (mm)</th> <th><math>X</math> (mm)</th> <th><math>B_{raw}</math> (T)</th> <th><math>B</math> (T)</th> <th><math>\ln(x)</math> <math>x</math> in m</th> <th><math>\ln(B)</math> <math>B</math> in T</th> </tr> </thead> <tbody> <tr><td>3</td><td>7</td><td>0.1576</td><td>0.1567</td><td>-4.962</td><td>-1.853</td></tr> <tr><td>4</td><td>8</td><td>0.1186</td><td>0.1177</td><td>-4.828</td><td>-2.139</td></tr> <tr><td>5</td><td>9</td><td>0.0951</td><td>0.0942</td><td>-4.710</td><td>-2.362</td></tr> <tr><td>6</td><td>10</td><td>0.0785</td><td>0.0776</td><td>-4.605</td><td>-2.556</td></tr> <tr><td>7</td><td>11</td><td>0.0657</td><td>0.0648</td><td>-4.510</td><td>-2.736</td></tr> <tr><td>8</td><td>12</td><td>0.0579</td><td>0.0570</td><td>-4.423</td><td>-2.864</td></tr> <tr><td>9</td><td>13</td><td>0.0445</td><td>0.0436</td><td>-4.343</td><td>-3.132</td></tr> <tr><td>10</td><td>14</td><td>0.0371</td><td>0.0362</td><td>-4.269</td><td>-3.318</td></tr> <tr><td>12</td><td>16</td><td>0.0321</td><td>0.0312</td><td>-4.135</td><td>-3.466</td></tr> </tbody> </table> <p>Plot:</p> <div style="text-align: center; margin-top: 10px;"> </div>	$\Delta x$ (mm)	$X$ (mm)	$B_{raw}$ (T)	$B$ (T)	$\ln(x)$ $x$ in m	$\ln(B)$ $B$ in T	3	7	0.1576	0.1567	-4.962	-1.853	4	8	0.1186	0.1177	-4.828	-2.139	5	9	0.0951	0.0942	-4.710	-2.362	6	10	0.0785	0.0776	-4.605	-2.556	7	11	0.0657	0.0648	-4.510	-2.736	8	12	0.0579	0.0570	-4.423	-2.864	9	13	0.0445	0.0436	-4.343	-3.132	10	14	0.0371	0.0362	-4.269	-3.318	12	16	0.0321	0.0312	-4.135	-3.466	<p>Correct label and unit for data: 0.1 pts</p> <p>Number of correct data for <math>x \leq 16</math> mm: 0.05 pts for each correct data, max 0.45 pts</p> <p>Plot:</p> <ul style="list-style-type: none"> <li>-Correct axis label and unit: 0.05 pts</li> <li>- Using around 75% of plot area: 0.05 pts</li> <li>-For each correct data point: 0.05 pts, max. 0.4 pts</li> <li>-Adding trendline: 0.1 pts</li> </ul>

<p>A.3 0.75 pts</p>	<p>Use your experimental data to determine the value of the exponent <math>p</math>.</p> <p>Linear regression (LR) <math>y = a + b x : B = \frac{\mu_0 m}{2\pi L x^p}</math></p> <p><math>\ln(B) = a - p \ln x</math> where <math>a = \ln\left(\frac{\mu_0 m}{2\pi L}\right)</math>.</p> <p>LR yields : <math>a = -11.765</math> and <math>b = -1.997</math></p> <p>The power exponent: <math>p = -b = 2.0</math></p> <p>Note that this is in very good agreement with the exact result: at short distance (<math>x &lt; L</math>) a diametric (or a dipole line) magnet has <math>B \sim 1/r^2</math> dependence. See Ref. [1] , Fig. 2c.</p>	<p>Obtaining <math>p</math> from graph: 0.05 pts Obtaining <math>p</math> from linear regression: 0.1 pts</p> <p>Result: <math>p = 1.8 - 2.2 : 0.65</math> pts <math>p = 1.6 - 2.4 : 0.35</math> pts</p> <p>Result with wrong sign: <math>p = (-1.8) - (-2.2) : 0.4</math>pts <math>p = (-1.6) - (-2.4) : 0.1</math>pts</p> <p>More than two sig. figs.: minus 0.05 pts</p>
<p>A.4 0.5 pts</p>	<p>Determine the magnet's magnetization <math>M</math>.</p> <p><math>m = \frac{2\pi L}{\mu_0} \exp(a) = 0.987 \text{ Am}^2</math></p> <p><math>M = \frac{m}{\pi R^2 L} = 1.2 \times 10^6 \text{ A/m}</math></p> <p>This is close to the more accurate results from more extensive measurements to far field (see Ref. [1], Fig. 2c) and we use this value for subsequent questions: <math>M = 1.1 \times 10^6 \text{ A/m}</math></p>	<p>Correct unit: 0.05 pts</p> <p>Obtaining intercept (<math>a</math>) from graph: 0.025 pts Obtaining intercept from LR: 0.05 pts</p> <p>Correct formula for <math>m</math> and/or <math>M</math> : 0.1 pts</p> <p>Result for <math>M</math> (<math>\times 10^6 \text{ A/m}</math>): <math>0.9 - 1.4 : 0.3</math> pts <math>0.1 - 2.5 : 0.15</math> pts</p> <p>More than 2 sig. figs.: minus 0.05 pts</p>

**2. The Magnetic Levitation Effect and Magnetic Susceptibility ( $\chi$ ) (1 pts)**

Question	Answer	Marks
<p>A.5 0.1 pts</p>	<p>Place gently a graphite rod HB/0.5 and length = 8 mm. Measure the levitation height <math>y_0</math> of the rod (see Fig. 7a). Hint: Use the insert ruler provided as shown in Fig. 7b. Press the ruler on the magnets to read the position of the graphite rod</p> <p>We levitate graphite HB/0.5, <math>l = 8</math> mm. Using the insert-ruler, we measure approximately <math>\Delta y = 1</math> mm from the top of the magnet surface. Thus: <math>y_0 = R - \Delta y = (3.2 - 1) \text{ mm} = 2.2 \text{ mm}</math></p>	<p>correct unit: 0.02</p> <p><math>y_0 = (1.7 - 2.2) \text{ mm} : 0.08</math> pts</p> <p>partial credit: Only <math>\Delta y = (1 - 1.5) \text{ mm} : 0.03</math> pts</p>

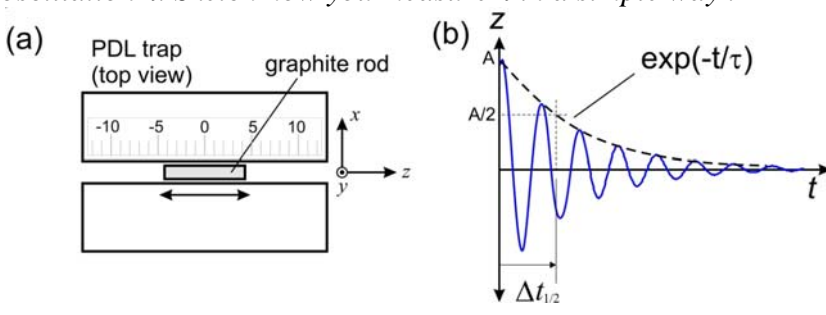

A.6 0.8 pts	<p>Use the result from part A.5 to determine the magnetic susceptibility <math>\chi</math> of the graphite rod.</p> <p>Solving for <math>\chi</math>: <math>mg = F_y = -\frac{\mu_0 M^2 \chi V_R R^4}{2 a^5} f_Y(y_0/a)</math></p> $\chi = -\frac{2\rho g a^5}{\mu_0 M^2 R^4 f_Y(y_0/a)}$ <p>We calculate: <math>a = R + g_M / 2 = (3.2 + 1.5/2) \text{ mm} = 3.95 \text{ mm}</math>.</p> <p>Using <math>y_0 = 2.2 \text{ mm}</math>: <math>f_Y(u) = \frac{4u(3-u^2)(1-u^2)}{(1+u^2)^5}</math>,</p> <p><math>f_Y(y_0/a) = f_Y(2.2/3.95) = 1.07</math></p> <p>Using the correct <math>M = 1.1 \times 10^6 \text{ A/m}</math>; and <math>R = 3.2 \text{ mm}</math>, <math>\rho = 1680 \text{ kg/m}^3</math> we have: <math>\chi = -1.85 \times 10^{-4}</math>.</p> <p>Note that this is very good agreement with the literature value for graphite pencil lead: <math>\chi = -2 \times 10^{-4}</math> (see Ref.[1], pg. 2 &amp; Ref.[2]). The sign is negative indicating a diamagnetic material.</p>	<p>Correct expression for <math>\chi</math>: 0.4 pts</p> <p>Result for <math>\chi</math> (<math>\times 10^{-4}</math>) -(1.4 to 2.6) : 0.4 pts -(0.5 to 4) : 0.2 pts</p> <p>Wrong sign: minus 0.1 pts</p>
A.7 0.1 pts	<p>What kind of magnetic material is graphite? Choose one: (i) Ferromagnetic; (ii) Paramagnetic; or (iii) Diamagnetic?</p> <p>(iii) Diamagnetic. Because: (1) Graphite is repelled by magnetic field (2) The sign of <math>\chi</math> is negative.</p>	<p>Correct choice: 0.1 pts</p>

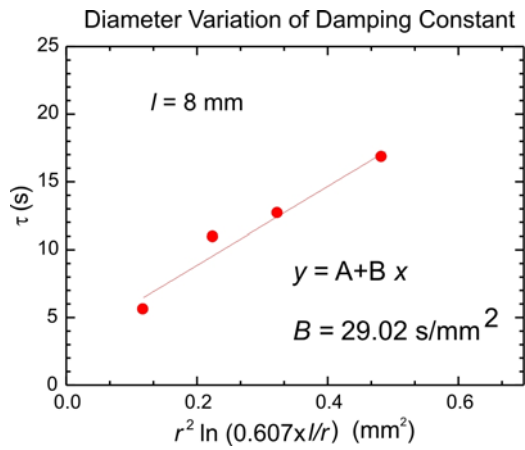

**3. The camelback potential oscillation and magnetic susceptibility ( $\chi$ ) (1 points)**

Question	Answer	Marks																		
A.8 0.2 pts	<p><u>Perform an oscillation for the "HB/0.5" graphite and <math>l = 8 \text{ mm}</math>. Limit to small oscillation amplitude i.e. <math>A &lt; 4 \text{ mm}</math>.</u></p> <p><u>Determine the oscillation period. (The oscillation will decay over time due to damping, ignore this damping effect).</u></p> <p>Example, we measured 5 oscillations of HB/0.5 with length <math>l = 8 \text{ mm}</math>. We displaced it by <math>\sim 3 \text{ mm}</math> and let it oscillates. We measured 5 oscillation periods:</p> <table border="1" style="margin-left: 20px; border-collapse: collapse; width: 80%;"> <thead> <tr> <th style="width: 10%;">Trial</th> <th style="width: 10%;">5 Tz</th> <th style="width: 10%;"></th> <th style="width: 10%;"></th> <th style="width: 10%;"></th> <th style="width: 10%;"></th> </tr> </thead> <tbody> <tr> <td></td> <td>(s)</td> <td></td> <td></td> <td></td> <td></td> </tr> <tr> <td>1</td> <td>6.12</td> <td></td> <td></td> <td></td> <td></td> </tr> </tbody> </table>	Trial	5 Tz						(s)					1	6.12					<p>Correct label and unit: 0.02 pts</p> <p>Number of correct data each 0.01 pts, max 0.03 pts</p> <p>Number of oscillation &lt; 3 : 0 pts &gt;= 3 : 0.05 pts</p> <p><math>T_z = (1.2 - 1.5) \text{ s}</math>: 0.1 pts</p>
Trial	5 Tz																			
	(s)																			
1	6.12																			

	<table border="1"> <tr> <td>2</td> <td>6.13</td> <td></td> <td></td> <td></td> <td></td> </tr> <tr> <td>3</td> <td>6.14</td> <td></td> <td></td> <td></td> <td></td> </tr> </table> <p>Average : <math>T_z = 1.23</math> s</p>	2	6.13					3	6.14					
2	6.13													
3	6.14													
A.9 0.8 pts	<p>Calculate the magnetic susceptibility (<math>\chi</math>) of the graphite using this oscillation</p> <p>For harmonic oscillator : <math>k_z = m_R \omega^2</math>, solving for <math>\chi</math>:</p> $\chi = -\frac{k_z}{C_1 \mu_0 M^2 V_r} = \frac{\omega^2 \rho}{C_1 \mu_0 M^2}$ <p>Using the correct <math>M = 1.1 \times 10^6</math> A/m. Using <math>C_1 = 198.6/\text{m}^2</math>, and <math>T_z = 1.23</math> s, we obtain <math>\chi = -1.5 \times 10^{-4}</math>.</p> <p>Note that this is in good agreement with the literature value of the graphite pencil lead: <math>\chi = -2 \times 10^{-4}</math> (Ref.[1], pg. 2); and the sign is negative indicating a diamagnetic material.</p>	<p>Correct expression for <math>\chi</math>: 0.4 pts</p> <p>Result for <math>\chi</math> (<math>\times 10^{-4}</math>) -(1.4 to 2.6) : 0.4 pts -(0.5 to 4) : 0.2 pts</p> <p>Wrong sign: minus 0.1 pts</p>												

**4. Oscillator quality factor ( $Q$ ) and estimate of air viscosity  $\mu_A$  (3.0 points)**

Question	Answer	Marks
A.10 0.5 pts	<p>We need to determine the damping time constant of the oscillation <math>\tau</math>. Sketch how you measure <math>\tau</math> in a simple way.</p>  <p>The trick is to use "half-time" concept of exponential decay. We set the oscillation and measure the time taken for the amplitude to halve. The lifetime is:</p> $\tau = \frac{\Delta t_{1/2}}{\ln 2}$	<p>Correct idea: 0.3 pts</p> <p>Correct expression for <math>\tau</math>: 0.2 pts</p>
A.11 1.5 pts	<p>Perform oscillation damping experiments with a group of rods with various diameters and fixed length of 8 mm. Determine the damping time constant <math>\tau</math> for each rods</p>	<p>Correct label and unit 0.1</p> <p>Number of correct data</p>

	<p>We displaced the graphite by ~4 mm, started the stopwatch and then waited until it decays to half.</p> <table border="1" data-bbox="300 398 1131 987"> <thead> <tr> <th>Trial</th> <th>Diam.</th> <th>Actual Radius</th> <th><math>\Delta t_{1/2}</math></th> <th>Mean <math>\Delta t_{1/2}</math></th> <th><math>\tau</math></th> <th><math>r^2 \times \ln(0.607/l/r)</math></th> </tr> <tr> <td></td> <td>(mm)</td> <td>(mm)</td> <td>(s)</td> <td>(s)</td> <td>(s)</td> <td>(mm<sup>2</sup>)</td> </tr> </thead> <tbody> <tr> <td>1</td> <td>0.3</td> <td>0.19</td> <td>3.89</td> <td>3.913</td> <td>5.646</td> <td>0.117</td> </tr> <tr> <td></td> <td></td> <td></td> <td>3.97</td> <td></td> <td></td> <td></td> </tr> <tr> <td></td> <td></td> <td></td> <td>3.88</td> <td></td> <td></td> <td></td> </tr> <tr> <td>2</td> <td>0.5</td> <td>0.28</td> <td>7.69</td> <td>7.617</td> <td>10.989</td> <td>0.224</td> </tr> <tr> <td></td> <td></td> <td></td> <td>7.57</td> <td></td> <td></td> <td></td> </tr> <tr> <td></td> <td></td> <td></td> <td>7.59</td> <td></td> <td></td> <td></td> </tr> <tr> <td>3</td> <td>0.7</td> <td>0.35</td> <td>8.77</td> <td>8.82</td> <td>12.73</td> <td>0.322</td> </tr> <tr> <td></td> <td></td> <td></td> <td>8.81</td> <td></td> <td></td> <td></td> </tr> <tr> <td></td> <td></td> <td></td> <td>8.88</td> <td></td> <td></td> <td></td> </tr> <tr> <td>4</td> <td>0.9</td> <td>0.45</td> <td>12.4</td> <td>11.70</td> <td>16.88</td> <td>0.482</td> </tr> <tr> <td></td> <td></td> <td></td> <td>11.33</td> <td></td> <td></td> <td></td> </tr> <tr> <td></td> <td></td> <td></td> <td>11.38</td> <td></td> <td></td> <td></td> </tr> </tbody> </table>	Trial	Diam. ## B. SENSOR APPLICATION OF THE PDL TRAP

### 5. PDL Trap Seismometer (0.5 pts)

Question	Answer	Marks
B.1 0.2 pts	<p><i>Which diameter of rod do you choose?</i></p> <p>To obtain the lowest acceleration noise floor "<math>a_n</math>" we should choose the largest diameter graphite i.e. 0.9 mm, because their damping time is the longest and the mass is the largest.</p>	Correct answer: 0.2 pts
B.2 0.3 pts	<p><i>Calculate the seismometer acceleration noise floor (<math>a_n</math>) for the rod of your choice!</i></p> <p>For HB/0.9 and length <math>l = 8</math> mm: We use <math>\tau = 16.9</math> s; and <math>T = 298</math> K, we have: <math>m_R = \rho \pi r^2 l = 8.55 \times 10^{-6}</math> kg :</p> $a_n = \sqrt{\frac{4k_B T \omega_0}{Q m_R}} = \sqrt{\frac{8k_B T}{\tau m_R}} = 1.5 \times 10^{-8} \text{ m}/(\text{s}^2 \text{ Hz}^{0.5})$	<p>Correct unit: 0.1</p> <p>Correct answer: 0.2 pts</p>

### 6. PDL Trap Tiltmeter (2 pts)

Question	Answer	Marks
B.3 0.5 pts	<p><i>Derive the relation theoretically between displacement <math>\Delta z</math> with the screw thread size <math>S</math> and the number of turns (<math>N</math>).</i></p> $k_z \Delta z = m g \sin \theta = m g N S / D \quad \Delta z = \frac{m g S N}{k_z D}$ <p>From Question 3, we also have <math>k_z = m \omega^2</math> :</p> $\Delta z = \frac{g S}{\omega^2 D} N$	<p>Correct expression: 0.5 pts</p> <p>Partial credit <math>k_z \Delta z = m g \sin \theta : 0.2</math></p>
B.4 1.25 pts	<p><i>By turning the screw slowly, determine the rod displacement <math>\Delta z</math> vs. the number of screw turns (<math>N</math>). Determine the thread size <math>S</math></i></p>	Correct label and unit: 0.1 pts

	<p>We measured the distance between screws: <math>D = 22</math> cm, and we used the period from Q3: <math>T_z = 1.23</math> s</p> <table border="1" data-bbox="303 436 1077 817"> <thead> <tr> <th><math>\Delta z</math> (mm)</th> <th><math>\phi</math></th> <th>N (turn)</th> <th></th> <th></th> <th></th> </tr> </thead> <tbody> <tr><td>0</td><td>0</td><td>0</td><td></td><td></td><td></td></tr> <tr><td>0.5</td><td>135</td><td>0.375</td><td></td><td></td><td></td></tr> <tr><td>1</td><td>270</td><td>0.75</td><td></td><td></td><td></td></tr> <tr><td>1.5</td><td>450</td><td>1.25</td><td></td><td></td><td></td></tr> <tr><td>2</td><td>585</td><td>1.625</td><td></td><td></td><td></td></tr> <tr><td>2.5</td><td>720</td><td>2.0</td><td></td><td></td><td></td></tr> <tr><td>3</td><td>855</td><td>2.375</td><td></td><td></td><td></td></tr> <tr><td>3.5</td><td>945</td><td>2.625</td><td></td><td></td><td></td></tr> </tbody> </table> <div style="display: flex; justify-content: space-around;"> <div data-bbox="311 862 790 1131"> <p>(a)</p> </div> <div data-bbox="790 862 1125 1176"> <p>(b)</p> </div> </div> <p>By performing linear regression: <math>y = a + b x</math></p> <p>We have <math>b = 1.287</math> mm/turns : <math>S = \frac{b \omega^2 D}{g} = 0.75</math> mm/turn.</p> <p>This is reasonably close to the actual value of the thread size: <math>S = (0.8 \pm 0.1)</math> mm/turn.</p>	$\Delta z$ (mm)	$\phi$	N (turn)				0	0	0				0.5	135	0.375				1	270	0.75				1.5	450	1.25				2	585	1.625				2.5	720	2.0				3	855	2.375				3.5	945	2.625				<p>Distance between screws: <math>22.8 &lt; D &lt; 22.2</math> cm : 0.1 pts</p> <p>Number of correct data: &lt; 3 sets : 0 pts 3-5 sets: 0.15 pts &gt;5 sets : 0.25 pts</p> <p>Obtaining result with linear regression or plot: 0.2 pts</p> <p>Result: <math>0.7 &lt; S &lt; 0.9</math> : 0.55 pts <math>0.5 &lt; S &lt; 1.1</math> : 0.15 pts</p> <p>Correct unit for S : 0.05</p>
$\Delta z$ (mm)	$\phi$	N (turn)																																																						
0	0	0																																																						
0.5	135	0.375
